

Deliverable 2: Project Proposal

Project Title:

(Go cheap).

Intended Use of the System

The system is designed to help users find the cheapest ride options by comparing prices across different ride apps such as Uber, InDrive, and DiDi. It is intended for anyone looking to save money on transportation, including daily students, and travelers. Users will access the system, enter their current location and destination.

Overall Functionality

The system collects fare information from multiple ride-hailing apps like Uber, InDrive, and DiDi, compares the prices, and recommends the cheapest options to the user. It helps users quickly find the most cost-effective rides, saving both time and money, and allows them to make informed decisions when booking transportation.
