Introduction

Go Cheap is a website where a user can compare and calculate different ride prices across different ride rental services and apps, it's meant to be simple and to the point.

It solves a problem we all had before, what if another app has cheaper rides? And how do I tell if it's even worth it?

Go Cheap handles all that and presents the top rides for the user to choose from with a sleek clean interface.

Deployment

In order to deploy you have to first develop these 5 aspects.

1- Design

The design stage is a crucial one for ensuring a consistent and easy UX, tools for which can be Figma or Adobe XD and within said tools one must keep track of color variables, border radii, UI elements scales for a clean and coherent interface, using dimmed color variables for muted elements and accent colors for highlighted ones.

2- Front End

Moving forward, now we take the design and apply it with HTML/CSS and JavaScript to actually the fully interactive website, using the design as reference, one must use its guidelines and follow its rules to achieve a consistent and readable UI.

3- Back End

Tying everything together, is the back end, it handles apis and their requests and basically everything that the user doesn't usually see, it makes the website actually functional and do its job and links it to the database.

4- Database

This is the website's warehouse, where all user and non-user data are stored, one must keep it organized for easy access by api.

5- Testing

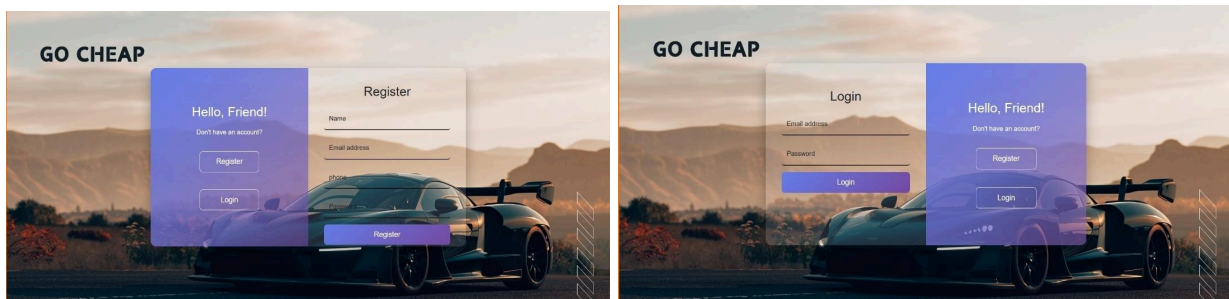

The final stage before deployment, one must test the entire UX and website features, making sure everything is going the way it should be

Walkthrough

A quick tour through the website.

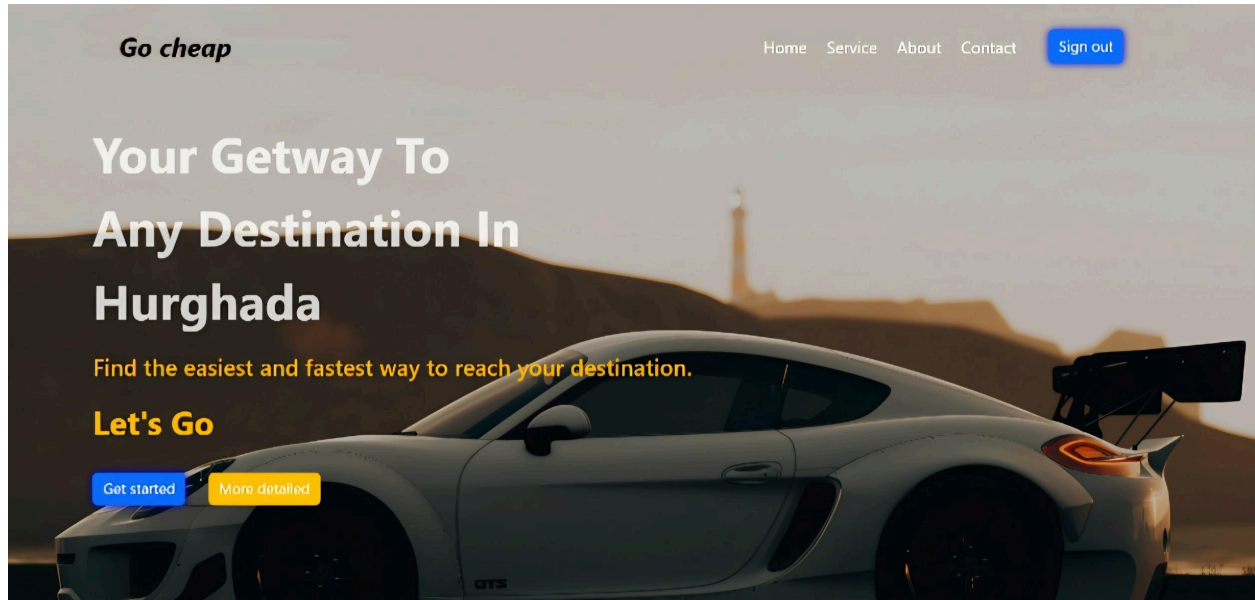

1- Login/Signup page

Provides a simple clean onboarding page for entering details to log into an account or create a new one.

2- Main Dashboard

Contains a minimalist interface with direct buttons to nearly everything in the website, the user uses it to navigate to the search page.

3- Search

This is where the core functionality of the website shines through, the search page, where you can search for pickup and destination rides along with prices and details about each one, the user searches for the preferred location and gets results relevant to the search terms, the user then can compare and decide the best ride.

The screenshot displays a web interface for searching rides. At the top, there's a title 'Search Pickup & Destination' in orange, followed by a subtitle 'Find the best ride options for your journey'. Below this are two input fields: 'ElDahar' and 'El Gouna', with a blue 'Search' button to the right. The results are presented in a 3x3 grid of ride cards. Each card features a company logo (Uber, inDrive, or BDO), a price tag, the route 'ElDahar → El Gouna', driver name, car model, trip duration, distance, and a 'Choose Ride' button.

Company	Price	Driver	Car Model	Trip Duration	Distance
Uber	\$50	Ahmed Ali	KIA	10 min	11 KM
Uber	\$45	Mohamed hussan	Honda	27 min	11 KM
Uber	\$48	mohamed ahmed	sedan	29 min	11 KM
inDrive	\$40	Mazen Ahmed	toyota Corolla	30 min	33 KM
inDrive	\$42	Sheref mohamed	Honda Civic	32 min	33 KM
inDrive	\$45	Mohsen Lekry	Ford Fiesta	27 min	33 KM
BDO	\$47	Wael Mumdouh	Mazda3	25 min	11 KM
BDO	\$55	Mina Emad	Kia Rio	25 min	11 KM
BDO	\$45	Reda Shokri	Chevrolet Spark	27 min	11 KM

4- About

The user can use this to learn more about the website and its advantages.

5- Contact

Finally this is where the user can get in touch with the development team for assistance.
